

Autogen Oasis Integration Manual

What This Script Does

Run three stages in one command:

- **Autogen** → Run `Autogen` at local machine
- **Sync** → Copy `Autogen` output to project folder
- **Oasis** → Live update IG-XL file without any needs to restart IG-XL

Requirements

1. Autogen Version

Must be $\geq 6.2.0$ to prevent unexpected diff behavior.

2. Oasis Version

Must be ≥ 4.7

2. Configuration

Update `appsettings.csv`:

- `Autogen` path
- `args.csv` path
- Project folder path

3. Input Files and setup documents

You need to update `args.csv` to make `Autogen` run properly.

Not recommended to use `Excel` to modify `args.csv`.

We recommend you to use the following editor to edit `args.csv`:

1. `NotePad++` with `CSV Lint` plugin.
2. `VSCode` or `Zed` with `Rainbow CSV` extension.
3. Any text editor with CSV lint ability.

We will use `NotePad++` with `CSV Lint` for this tutorial.

Now let's start editing `args.csv` to be able to run `Corfu` on local machine

```

--cslibrarypath, C:\Victor\envs\corfu\central_library_cs\bin

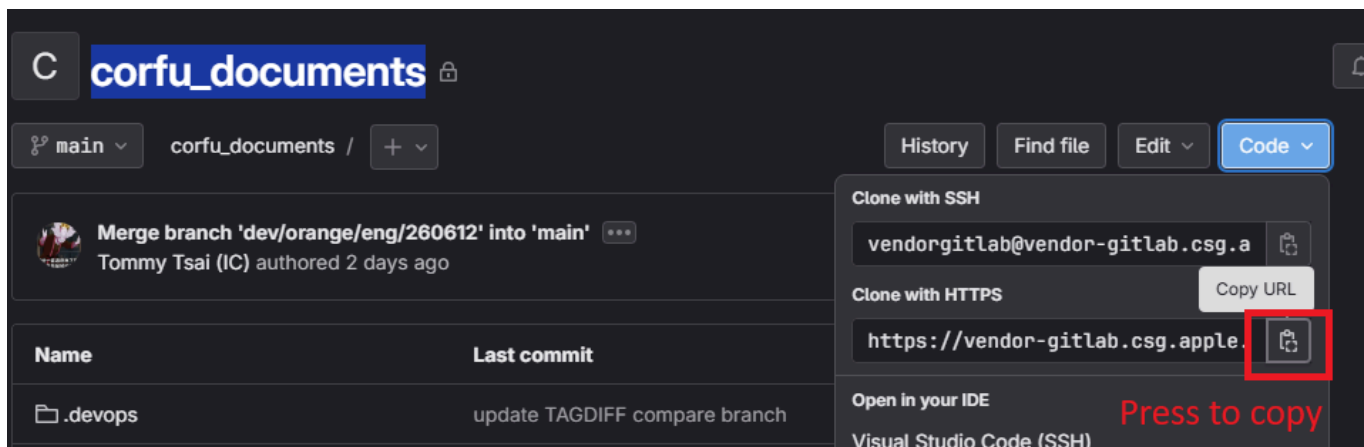

```

At first glance, it looks very complicated. But we can use Jenkins 's output as our template.

Clone target document

Since we use Corfu as example. Now let's go to corfu_documents repository on [Vendor GitLab]([seg-soc / projects / corfu / corfu_documents · GitLab](https://vendor-gitlab.csg.apple.com/seg-soc/projects/corfu/corfu_documents))

Then clone the document(Please switch to the branch you want to run, in this example we will just use main)

Then clone to local machine with git clone:

```
git clone https://vendor-gitlab.csg.apple.com/seg-soc/projects/corfu/corfu_documents.git
```

Find output on Jenkins

Now let's go to Jenkins to find output we need. (In this example, we will go to Jenkins from Vendor GetLab).

C corfu_documents

Fetch all the data we need from output

Now we are going to use `B0_V04A_CP1` as example.

We need to the following data from output.

1. Test plan
2. C# central library
3. `tautogen.log`

C# central library

This is required for `args.csv`

Located at `output\B0_V04A_CP1_#4\B0_V04A\CP1\IGLink\central_library_cs\bin`

Test plan

This is required for `args.csv`

Located at

`output\B0_V04A_CP1_#4\B0_V04A\CP1\Corfu_B0_TestPlan_V04A_X_22285b3d.xlsx`

tautogen.log

This is the key item to populate `args.csv`

Located at `output\B0_V04A_CP1_#4\task_data\tautogen.log`

```

--baslibraryfolder, C:\Victor\envs\corfu\corfu_documents\IGXFiles\VBt
--cslibrarypath, C:\Victor\envs\corfu\central_library_cs\bin
```

Common pitfalls

There are something that very easy to make mistakes while modifying `args.csv`

1. Array values

1. Arguments like `--voltagetablefile` and `--ttr` are arrays that is separated by comma
2. In order to not break csv file format because of these arguments, please use double quotes to wrap these values.

```
--ttr, "C:\Victor\envs\corfu\corfu_documents\B0_V04A\Corfu_B0_TTR_V04A_X_DIGHardIP_1.xlsx,C:\Victor\envs\corfu\corfu_documents\B0_V04A\Corfu_B0_TTR_V04A_X_X#7.xlsx"
```

2. Autogen outputs

1. Arguments like `--logfolder` and `--outputFile` are Autogen outputs.
2. `--outputFile` must be `<your-desired-folder>\Validation_ErrorReport.xlsx`

1. Even though this looks like a variable used for error report only, but it will also determine where final Autogen output located.
3. `--logfolder` is where your Autogen logs located. Recommended to put it in the same folder as `--outputFile` (`<your-desired-folder>\.logs`)
3. baslibraryfolder
 1. Usually, all the VBT files are submodule located at `corfu_documents` (`corfu_documents\IGXLFiles\VBT`)
 2. So remember to update submodule, or you will get empty folder under VBT folder
4. cslibrarypath
 1. You should use the same library we downloaded from Jenkins pipeline to prevent from version mismatch. (Vresion mismatch will cause output difference)

4. Before execute

You need to open your `*.igxl` file in your project folder before running script, or `oasis` cannot find any target to update

Run Script

Go to script root, open terminal and execute following code.

```
Main.ps1
```

```
PowerShell 7 (x64) X + v
PS C:\Victor\envs\corfu\AutogenOasisIntegration> .\Main.ps1
```

If all arguments are set properly, it should run with no problem.

```
PowerShell 7 (x64) X + v

PS C:\Victor\envs\corfu\AutogenOasisIntegration>
```

Execute stage by stage

This script not only can run three stages in one go, it can also run separately.

For example:

```
Main.ps1 -Mode Autogen
```

This will only run `Autogen`. With this, you can manually check `Autogen` output before any update. This can also be achieved by running `RunAutogen.bat`.

```
Main.ps1 -Mode Sync
```

This will only copy Autogen output to target project folder. This can also be achieved by running `RunSync.bat` .

```
Main.ps1 -Mode Oasis
```

This will only live update IG-XL file. This can also be achieved by running `RunOasis.bat` .

Troubleshooting

1. File Main.ps1 cannot be loaded because running scripts is disabled on this system.

This is caused by Windows security not allowing execution of PowerShell script . One possible solution is to execute `RunXXX.bat` under root folder. Those `.bat` files contains arguments to bypass Windows policy.

2. Cmd shows nothing while executing Main.ps1

This is possibly also caused by Windows security not allowing execution of PowerShell script . This can be confirmed by execute `Main.ps1` inside PowerShell instead of cmd. If it shows Windows security not allowing execution of PowerShell script , then please following the troubleshooting above to fix it.
